Quiz Topics for Science and Technology

1. Glossary terms

You will be given the definition and asked for the term. <u>https://institutebishop.org/Glossary Science.pdf</u> (for the quiz)

2. For the chemical weapons chlorine, phosgene, sulfur mustard, hydrogen cyanide, sarin, VX, Novichok, fentanyl, BZ, and ricin, be able to describe each of the following.

http://institutebishop.org/chemical_weapons_1.pdf

http://institutebishop.org/chemical_weapons_2.pdf

https://institutebishop.org/chemical_weapons_review.pdf

- a. Identify the chemical structure from a line drawing or Lewis structure (For example, I may give you a structure and ask you which of the chemical agents listed above it represents.)
- b. List examples of its use as a chemical weapon, if any.
- c. Identify whether it's more likely to be lethal or incapacitating.
- d. How it can be obtained and the relative difficulty in obtaining it compared to the other chemical weapons
- e. How it can be dispersed and the relative difficulty of dispersing it.
- f. Whether or not it has uses other than as a chemical weapon.
- g. Which CWC schedule it's listed on (if any)
- h. Its physiological effects and the symptoms that arise from them
- i. Its relative persistence on the ground
- j. Necessary protective gear
- k. Treatment for exposure
- l. How it can be destroyed
- 3. Write a description of the effects of nerve agents on the body and explain why atropine, 2-PAM, and Valium act as antidotes. (Your description should include mention of nerve cells, neurotransmitters, acetylcholine, receptor sites, acetylcholinesterase, the on-off mechanism of nerve cells, and competition for receptor sites.) (see slides 42-57 of https://institutebishop.org/chemical_weapons_review.pdf)
- 4. Describe the pros and cons of using either sarin or VX as a nerve agent. (see slide 61 of <u>https://institutebishop.org/chemical_weapons_review.pdf</u>)
- 5. Describe at least five differences between toxins and chemical weapons. (see slide 88 of https://institutebishop.org/chemical_weapons_review.pdf)

- 6. For the Chemical Weapons Convention, CWC, describe each of the following. (see https://institutebishop.org/chemical_weapons_review.pdf)
 - a. General purpose (slide 90)
 - b. General Obligations (slides 91 and 92)
 - c. Level of international cooperation (slide 93)
- 7. Describe the CWC Schedules 1, 2, and 3, parts A and B.

(see https://institutebishop.org/chemical_weapons_review.pdf slides 99-102)

- Describe the purpose of the Organisation for the Prohibition of Chemical Weapons (OPCW) (see <u>https://institutebishop.org/chemical_weapons_review.pdf</u> slides 103 and 104)
- 9. Describe the steps that the OPCW goes through to determine whether chemical weapons have been used. (see slides 105 and 106 of <u>https://institutebishop.org/chemical_weapons_review.pdf</u>)
- 10. Given the Lewis structure of sarin, describe the products of its hydrolysis.

(see https://institutebishop.org/chemical_weapons_review.pdf slide 107)

- 11. One of the ways to discover whether sarin was used in a chemical attack is to test for the presence of isopropyl methylphosphonic acid (IMPA). List two reasons why IMPA is more likely to be found after a sarin attack than the sarin itself, and explain why the detection of IMPA is an indication that sarin was present where the IMPA was found. (see https://institutebishop.org/chemical_weapons_review.pdf slide 108)
- 12. Describe how a GC/MS (gas chromatograph/mass spectrometer) can be used to detect chemical weapons, and use this to explain why it is important that small quantities of chemicals that might be used as chemical weapons are synthesized and analyzed before detection is attempted. (see https://institutebishop.org/chemical_weapons_review.pdf slides 109-113)
- 13. Describe the goals of the Australia Group and describe some of the difficulties in achieving these goals. (see slides 122-129 of <u>https://institutebishop.org/chemical_weapons_review.pdf</u>)
